RE: 34th Street PRB Monitoring and Evaluation

Dear Ms. Cunningham:

Zephyr Environmental Corporation (Zephyr) observed the installation of a permeable reactive barrier (PRB) performed by the US Air Force contractor, Shaw Environmental & Infrastructure, Inc. (Shaw), in San Antonio, Texas from March 24 through April 28, 2004. The purpose of this observation was to provide written and photographic documentation of the PRB installation and to monitor the air at the perimeter of the work-site for potential concerns to public health. The results of the observation are detailed in attachments to this letter:

Attachment A contains a detailed summary of Zephyr's observations;
Attachment B contains a drawing of VOC and PM monitoring locations;
Attachment C contains photographs of site activities; and
Attachment D contains VOC and PM monitoring data (Table 1 and 2).

Zephyr's role during this activity was to monitor the air at the public/work-site interface for volatile organic compounds (VOCs) and particulate matter (PM) and observe operations for potential environmental concerns; it was not in our purview to be directive to the Air Force contractors. It appears after monitoring and observation of the operations performed that there were no public health concerns and no unmitigated environmental concerns due to activities related to the PRB installation.

We appreciate the opportunity to perform this project for you. Please call me at 512-329-5544 if you have any questions or comments about this report or the information contained herein.

Sincerely,
Zephyr Environmental Corporation

Joe Zupan, P.E.
Principal

**ATTACHMENT A
SUMMARY OF OBSERVATIONS**

Attachment A – Summary of Observations

On March 24 through April 28, 2004, Zephyr observed the installation of a PRB at 34th Street in San Antonio, Texas. Shaw contracted Remedial Construction Services (RECON) to perform the construction activities related to installation of the PRB. The PRB was installed as follows:

- ◆ mobilizing equipment and supplies onto the work-site,
- ◆ mixing guar to keep excavation stable,
- ◆ excavating trench to below contaminated zone within the aquifer - approximately 31.5 feet,
- ◆ removing excavated soil to spread area on Air Force Base,
- ◆ filling trench with guar mixture,
- ◆ mixing iron and sand,
- ◆ placing iron and sand mixture into trench to desired depth below ground surface (bgs),
- ◆ placing circulation wells at 25 feet intervals along length of trench
- ◆ back-filling trench (above iron sand mixture) to approximately 6 feet bgs with sand,
- ◆ circulating guar mixture with circulation wells,
- ◆ removing circulation wells,
- ◆ placing one layer of geo-textile fabric on top of sand layer,
- ◆ back-filling remaining 6 feet of open trench to street level with red clay, and
- ◆ demobilizing and site cleanup.

The following summarizes the results of the air monitoring and environmental observation during construction activities. In addition, Attachment B provides a drawing of VOC and PM monitoring locations, Attachment C provides photographs of the construction and monitoring operations, and Attachment D provides data from VOC and PM monitoring operations.

VOC and PM Monitoring

Air quality monitoring for VOCs and PM was performed by Zephyr for the duration of the construction activities. VOCs were monitored using a Rae Systems Mini Rae 2000 Photoionization Detector and a Thermo Environmental Instruments, Inc. Model 580 B Organic Vapor Monitor. VOC monitoring was conducted at 15-minute intervals during activities related to media believed to contain COCs. Zephyr field personnel manually recorded VOC levels. PM was monitored using a Thermo Anderson Personal Data RAM model pDR 1000 AN. PM monitoring was conducted at 1-hour intervals with the 1-hour averages being recorded by the pDR. All monitoring equipment was calibrated according to manufacturer specifications prior to monitoring operations. Both monitors were rented from Geotech Environmental Equipment, Inc. (Geotech), of Denver, Colorado.

For VOCs, the do-not-exceed limit was established using the lowest limit published for known or possible COCs. The lowest do-not-exceed limit published by the American Conference of Governmental Industrial Hygienists (ACGIH) in their 2003 TLVs and BEIs handbook for all COCs previously reported is 5 parts per million (ppm) – 15 minute Short Term Exposure Limit for vinyl chloride. This limit was used as a ceiling for monitoring operations and had it been reached at any time during construction activities, Zephyr would have notified the City of San Antonio – Metro Health Department and Shaw's onsite contact.

Attachment A – Summary of Observations

Airborne particulate matter (PM) is generally classified by aerodynamic particle size, which is specified in microns. A subscript is used to denote the size classification of the PM, so PM less than 30 microns in diameter is usually indicated as PM₃₀. The National Ambient Air Quality Standards (NAAQS), adopted by the EPA, establishes the maximum concentrations and time periods that are considered acceptable for PM₁₀. Over a 24-hour period, an average concentration of .150 mg/m³ of PM₁₀ will meet the NAAQS. Annually, the average concentration must be 50 ug/m³ or less.

The Texas Commission on Environmental Quality (TCEQ) has adopted the NAAQS and has established additional rules that limit short-term concentrations of PM₃₀. PM₃₀ is sometimes referred to as Total Suspended Particulate (TSP), since material greater than 30 microns in diameter generally does not stay suspended in the air for extended periods of time. 30 Texas Administrative Code (TAC) 111.155 establishes a maximum one-hour concentration of .400 mg/m³ and a three-hour average of .200 mg/m³.

The PM₁₀ concentration can be estimated from the TSP concentration by using a ratio of the particle size multipliers (K values) found in the *Compilation of Air Pollutant Emission Factors, AP-42, Fifth Edition, Section 13.2.4 – Aggregate Handling and Storage Piles*. The K value for TSP is 0.74 and the K value of PM₁₀ is 0.35. Taking the ratio of the two K values results in a ratio of 2.11, meaning the concentration of TSP is 2.11 times more than the concentration of PM₁₀.

A PM₁₀ concentration of .189 mg/m³ would be equivalent to a TSP concentration of .400 mg/m³ (.189 x 0.74 /0.35 = .400). By monitoring the PM₁₀ concentration in the ambient air, the TSP can be estimated, and maintaining the PM₁₀ level below .189 mg/m³ ensures compliance with the 30 TAC 111 requirements.

Mobilization

RECON performed site mobilization from March 24 to March 30. Mobilization activities included bringing needed equipment and supplies on site and setting up workstations for guar and sand/iron mixing operations.

Three large storage tanks were brought onsite for water and guar storage. Water was obtained from a San Antonio Water Systems fire hydrant located just north of the job site. Other equipment included pumps, generators, conveyors, mixers, front-end loaders, forklifts, backhoes, and other hand held power tools needed for various operations related to construction activities.

Dust generated during this phase of work was minimal and did not appear to be at or near levels that would be of concern to public health and/or the environment. Soil disturbance was minimal and no soils believed to contain Chemicals of Concern (COCs) were disturbed. Therefore, PM and/or VOC monitoring was not performed during mobilization activities.

Photos 1-4 show contractors mobilizing equipment and supplies.

Attachment A – Summary of Observations

Construction

During construction activities, dust was generated and soil located in the aquifers known contaminated zone was disturbed and brought to the surface. Therefore, monitoring for VOCs and PM was conducted during this entire phase of work. VOCs and PM were monitored at five separate locations, dependant upon wind direction. Attachment B contains a drawing showing monitoring locations in relation to construction activities and nearby homes. Upwind baseline readings were recorded prior to monitoring operations. Most monitoring was done at Monitoring Location 1 and Monitoring Location 2 due to either prevailing south/southeast or periodic north/northwest winds. Monitoring was not conducted during inclement weather, including light rain (equipment can be damaged if used during heavy drizzle or rain).

VOCs

VOCs were monitored when soil was excavated from the trench, when soil was being transferred to transportation vehicles, or water from the contaminated aquifer was being brought to the surface. Levels were most often at or just above non-detectable (0.0 ppm). On April 4, and two other occasions readings were elevated slightly, up to 4.0 ppm and the monitor showed a "LAMP" alarm, meaning the lamp is not functioning properly. These levels were not consistent with readings from earlier monitoring and further investigation was warranted. Readings taken directly down wind, within five feet of the excavation were non-detectable (0.0 ppm). Readings taken directly down wind, within five feet of the excavator and a gas powered generator showed levels up to 12.0 ppm. Therefore, it can be concluded that the levels detected were not from COCs, but from exhaust emitted by gas powered construction equipment. The monitor was replaced on two occasions due to "LAMP" error readings.

On April 23, Geotech representatives stated that the MiniRae 2000 is sensitive to humidity levels above 85% and that the monitor can be overly sensitive to exhaust fumes when humidity levels are elevated. The "LAMP" error messages received on earlier occasions were most probably due to humidity. Geotech advised Zephyr that another monitor model would be more appropriate for the humid conditions. The MiniRae 2000 was exchanged for a Thermo Environmental Instruments Model 580 B Organic Vapor Monitor. No problems with the new monitor were encountered. It should be noted that the Geotech Representatives stated that more humidity makes the monitor more sensitive. The levels indicated by the MiniRae 2000 downwind of excavation activities did not exceed 5 ppm.

PM

Due to heavy rains and saturated soil, actual excavation of the trench generated very little dust. Most work was done on the paved street and noticeable dust was generated when saturated soil dried and was disturbed by equipment and/or dump trucks driving over it.

Some dust was also generated from sand/iron mixing operations. Prevailing southeast or northwest winds kept the dust from migrating toward nearby houses. Dust levels exceeded 189 ug/m³ on one occasion during construction. On April 15, sand/iron-mixing activities caused dust to migrate toward monitoring location 5 in excess of .189 mg/m³ (.195ug/m³ – 1hour average.). Wind was very slight from the north and cool damp weather conditions kept the dust from dissipating quickly. The dust migrated toward the south and onto the nearby Air Force Base and did not impact nearby homes (see Attachment B).

No other excursions occurred during the construction phase of the project.

Attachment A – Summary of Observations

Other Environmental Issues

On April 18, RECON broke a high-pressure hydraulic hose on the trench excavator. The hose was not in the trench at the time of rupture and the leaking fluid spilled onto the paved road. Approximately two gallons of hydraulic oil spilled on the road surface and was immediately cleaned up with absorbent pads and sand. No soil appeared to be impacted.

Photos 5-10 show construction activities.

De-mobilization and Cleanup

During the de-mobilization and cleanup phase, no media believed to contain VOCs was disturbed. All soil and/or groundwater from the contaminated aquifer either transported off site and groundwater was circulated back into the trench. Therefore, VOC monitoring was not conducted during this phase of the project.

Dust generated during cleanup operations was noticeable in the general area where equipment was being used. A front-end loader was used to smooth the surface inside the yard and to remove soil from the road after construction. Most of this dust dissipated prior to reaching the public/work-site interface. Prevailing southeast or northwest winds kept the dust from migrating toward nearby houses. On April 27, street-sweeping activities caused dust to migrate toward monitoring location 2 in excess of .189 mg/mg³ (.200mg/m³ – 1hour average). The street sweeper traveled within five feet of the monitor and heavy dust was visible for three to five minutes. The dust migrated toward the south and onto the nearby Air Force Base and did not impact nearby homes (see Attachment B). Operations were stopped immediately and the street was wetted prior to continued sweeping. Dust levels were immediately reduced and the wetting technique was used for all subsequent sweeping activities.

No other excursions occurred during the de-mobilization and cleanup phase of the project.

Photos 11 and 12 show cleanup activities.

Conclusions

Results of air quality monitoring during PRB installation activities lend to the following conclusions:

- ◆ no VOCs related to contaminated soil and/or groundwater were detected,
- ◆ PM was only measured above 189ug/m³ on two occasions,
- ◆ wind direction during both instances was away from houses and nearby neighborhoods (see Attachment B) and toward the Air Force Base, and
- ◆ no issues affecting public health and/or the environment were noted during any phase of the project.
